

SC 10 POTENTIAL ENERGY PROBLEMS

KEY

Practice Questions: (Your solutions should be organized similar to the example problem. Show all your steps please)

1. A goat jumps up in the air and reaches a height of 39.0 m above the surface of the Earth. How much potential energy will the 31.0 kg goat have at this height?

$$\begin{array}{l}
 h = 39.0 \text{ m} \\
 m = 31.0 \text{ kg} \\
 g = 9.80 \frac{\text{N}}{\text{kg}} \\
 E_p = ?
 \end{array}
 \left|
 \begin{array}{l}
 E_p = mgh \\
 = (31.0)(9.80)(39.0) \\
 = 11848.2 \text{ J} = 11800 \text{ J} \\
 11.8 \text{ kJ}
 \end{array}
 \right.$$

2. If a rock has 250 MJ of potential energy while sitting on the edge of a cliff 42.0 m above the valley floor, what is its mass?

$$\begin{array}{l}
 E_p = 250 \text{ MJ} \\
 = 250\,000\,000 \text{ J} \\
 h = 42.0 \text{ m} \\
 g = 9.80 \text{ m/s}^2 \\
 m = ?
 \end{array}
 \left|
 \begin{array}{l}
 E_p = mgh \\
 \therefore m = \frac{E_p}{gh} = \frac{250\,000\,000}{9.8(42.0)} \\
 = 607\,000 \text{ kg}
 \end{array}
 \right.$$

3. The International Space Station is 405 km above the Earth's surface and has a mass of 419 000 kg. If the gravitational field strength is only 8.72 N/kg at this altitude, how much potential energy does the ISS have?

$$\begin{array}{l}
 h = 405 \text{ km} = 405\,000 \text{ m} \\
 m = 419\,000 \text{ kg} \\
 g = 8.72 \frac{\text{N}}{\text{kg}} \\
 E_p = ?
 \end{array}
 \left|
 \begin{array}{l}
 E_p = mgh \\
 = (419\,000)(8.72)(405\,000) \\
 = 1.48 \times 10^{12} \text{ J} = 1.48 \text{ TJ} \\
 (1\,480\,000\,000\,000 \text{ J})
 \end{array}
 \right.$$

4. If you had a job lifting books from the floor up onto a bookshelf ($h = 1.70 \text{ m}$), and the average book had a mass of 1.20 kg, and you had 1000 books to put away, how much extra potential energy would all those books have when you were done? Where did this energy come from?

$$\begin{array}{l}
 h = 1.70 \text{ m} \\
 m = 1.20 \text{ kg} \\
 \times 1000 \\
 g = 9.80 \frac{\text{N}}{\text{kg}} \\
 E_p = ?
 \end{array}
 \left|
 \begin{array}{l}
 E_p = mgh \\
 = (1.20)(1000)(9.8)(1.70) \\
 = 19992 \text{ J} \\
 = 20.0 \text{ kJ}
 \end{array}
 \right.$$

5. If 9.75 kJ of E_p was given to a lemon while lifting it, and the lemon had a mass of 218 g, how high was it lifted?

$$\begin{array}{l}
 E_p = 9.75 \text{ kJ} \\
 = 9750 \text{ J} \\
 m = 218 \text{ g} \\
 = 0.218 \text{ kg}
 \end{array}
 \left| \begin{array}{l}
 g = 9.80 \\
 h = ?
 \end{array} \right.
 \begin{array}{l}
 E_p = mgh \\
 h = \frac{E_p}{mg} = \frac{9750}{0.218(9.80)} = 4563 \text{ m} \\
 = 4.56 \text{ km}
 \end{array}$$

6. How high could a 60.0 kg pole vaulter get above the ground if she could convert 2975 J of energy into E_p ?

$$\begin{array}{l}
 m = 60.0 \text{ kg} \\
 E_p = 2975 \text{ J} \\
 g = 9.80 \frac{\text{N}}{\text{kg}}
 \end{array}
 \left| \begin{array}{l}
 E_p = mgh \\
 \therefore h = \frac{E_p}{mg} = \frac{2975}{(60.0)(9.80)} = 5.0595 \text{ m} \\
 = 5.06 \text{ m}
 \end{array} \right.$$

7. What is the mass of one chocolate chip if throwing it 2.10 m vertically into the air requires 68.5 mJ of energy? (ignoring energy lost to friction)

$$\begin{array}{l}
 h = 2.10 \text{ m} \\
 E_p = 68.5 \text{ mJ} \\
 = 0.0685 \text{ J} \\
 g = 9.80
 \end{array}
 \left| \begin{array}{l}
 E_p = mgh \\
 \therefore m = \frac{E_p}{gh} = \frac{0.0685}{(9.80)(2.10)} = 0.003328 \text{ kg} \\
 = 3.33 \text{ g}
 \end{array} \right.$$

8. An astronaut jumping on the moon could get his 140 kg of mass (body plus space suit) to a height of 1.73 m above the surface (measured to his center of mass). At this point, his E_p was only 412 J. What must the gravitational field strength be on the moon?

$$\begin{array}{l}
 m = 140 \text{ kg} \\
 h = 1.73 \text{ m} \\
 E_p = 412 \text{ J} \\
 g = ?
 \end{array}
 \left| \begin{array}{l}
 E_p = mgh \\
 \therefore g = \frac{E_p}{mh} = \frac{412}{140(1.73)} = 1.7010 \frac{\text{N}}{\text{kg}} \\
 = 1.70 \frac{\text{N}}{\text{kg}}
 \end{array} \right.$$

9. If the mass of an object were to suddenly double, what would happen to its E_p ?

$$\underline{E_p} = \underline{m}gh \quad \text{DOUBLES}$$

10. If the height of an object were to suddenly double, what would happen to its E_p ?

$$\underline{E_p} = mg\underline{h} \quad \text{DOUBLES}$$
